

FEEDBACK FROM SPRINT 3:

- Our workflow was finally *FLOWING* this sprint. I felt that we worked well together and that expectations were clear.
- Props to Darrion who helped teach us all how to do database stuff for our functionality.
- This sprint felt a lot more organised with little scope creep. Thanks to everyone for sticking to what was discussed.
- Excellent jumps in functionality. I was really pleased to see Rebecca and Thabang taking on and succeeding at the most technical tasks of the sprint, with substantial increased in the website's capabilities. We achieved our main aim of Database interaction, adding users, trips, destinations, logs and invitations.
- There was no progress in Testing, which is a major problem. Having followed a path without TDD, we are in a precarious position for the conclusion of the project with 1/5 of the rubric heavily weighting Tests and Coverage.
- Review quality and team-familiarity with the overall code base also improved, with better organisation, cleaner organisation.
- Significantly better in terms of stories completed
- The sprint felt like it went a lot better since we had better defined roles and we got the freedom to work on them more independently
- There is still room for improvement in how we define user stories. Some of them are pretty wide horizontally and could actually be split into two user stories - thus increasing our sprint velocity.
